

WHERE THE MONEY SITS

Why gold keeps taking your stop, and what to do about it.

UPDATED COMPANION — July 2026

Rajesh Sha · First Edition + current TradingView tool

This updated PDF adds: the live tool paste link (v6.7.7), Melbourne ↔ New York clock for now (AEST / July), chart lessons from the book, the one-page map, and how each line maps to Gold Liquidity Sweep PRO.

Not financial advice. Explains how gold liquidity behaves. No buy/sell calls. Trading is risky.

1. The free map tool (updated)

Chapter 23 of the book says the TradingView tool draws Part 2 lines, keeps the Part 3 clock, and marks the Part 4 steps. Current paste build:

Gold Liquidity Sweep PRO v6.7.7 — SMART LABELS

Paste URL:

https://raw.githubusercontent.com/rajesh-sha/GoldPine/cursor/gold-liq-sweep-pro-v3-09e0/GOLD_FINAL_PASTE_THIS.txt

Open link → Select All → Copy → TradingView Pine Editor → Paste → Save → Add to **OANDA:XAUUSD** 1-minute.

- **Trade clock** = **America/New_York** (killzones, news, day/week opens)
- **Display clock** = **Australia/Melbourne** (table shows Melb + NY together)

The tool does not tell you what to buy. It draws the map. Decision stays yours.

2. The clock — New York, with Melbourne (NOW)

July 2026 → Melbourne is on **AEST (UTC+10)**. Use the highlighted column. NY is on EDT (UTC−4). Gap ≈ 14 hours.

WINDOW	NEW YORK	MELB NOW (Jul / AEST)	MELB summer (AEDT)
Overnight box	8:00pm–12:00am	10:00am–2:00pm	12:00pm–4:00pm
London killzone	2:00am–5:00am	4:00pm–7:00pm	6:00pm–9:00pm
New York killzone	8:30am–11:00am	10:30pm–1:00am	12:30am–3:00am
Best hour	10:00am–11:00am	12:00am–1:00am	2:00am–3:00am
London close (out)	11:00am–12:00pm	1:00am–2:00am	3:00am–4:00am
NY lunch (out)	12:00pm–1:30pm	2:00am–3:30am	4:00am–5:30am
Friday late (out)	after 3:00pm	after 5:00am Sat	after 7:00am Sat

Yellow column = use this in July (Melbourne AEST).

Do not trade: London going home · NY lunch · Friday after 3pm NY · around CPI/NFP/FOMC · dead days.

3. The one-page map

LINES TO DRAW

LINE	PILE	UPDATE	IN THE TOOL
Yesterday high / low (NY day)	Big	Daily	PDH / PDL
Last week high / low	Big	Weekly	PWH / PWL
Overnight high / low (Asia box)	Big	After overnight	Asia-H / Asia-L
Round numbers (\$10)	Big	When price moves	RND labels
20 / 40 / 60 day highs & lows	Big	Daily	IPDA / 20-day
Day / week / midnight opens	Reference	Daily / weekly	DAY / WEEK / NY OPEN
Twin tops / bottoms	Small — bait	As they form	EQH / EQL
Today high / low live	Big	All day	Day-H / Day-L

THE FOUR STEPS

1. Fake move — past a line you drew. About \$2–10 on gold. Closes back inside. Tail $\geq$ ■ of candle.

2. Bigger pile check — bigger magnet just past it? If yes, stand down (two-layer trap).

3. Turn — body close past the last peak/dip within ~30 minutes (not a wick).

4. Pullback — enter at gap / last opposite candle / broken line. Best where they overlap.

Stop past the fake extreme (+ buffer). Target = next real pile (red/green dashed cash-out rails).

4. Chart lessons from the book

Use this beside the original PDF chart pages (CHART X.Y captions).

Chart 4.1 / 4.2 — Yesterday high/low — fake vs real

Fake = fast poke + long tail, body back inside. Real = settles past and often retests from the other side.

Chart 5.1 / 5.2 — Overnight (Asia) box + London

Classic London trap: pop the box, come back, day goes the other way. Real break never returns inside.

Chart 6.1 / 6.2 — Round numbers

Fake often only \$1–4 through a \$10 level. Real break sits and uses the number as a floor/ceiling.

Chart 7.1 / 7.2 — Twin tops / bottoms

Cleanest fakes — but not a promise. Sometimes the stop pile becomes fuel and price keeps going.

Chart 8.1 / 8.2 — Day / week / midnight opens

Return magnets (cash-out / bounce tags), not mainly stop piles.

Chart 9.1 / 9.2 — 20/40/60-day highs & lows

Bigger, slower money. Good honest targets. Fakes here are larger and slower.

Chart 10.1 / 10.2 — Two-layer trap

Small pile fake = bait. Real turn usually at the big pile past it.

Chart 11.1 — Full NY day shaded

Same pattern means different things by session. Measure gold on New York time.

Chart 12.1 / 12.2 — London trap vs real London break

Trap comes back inside fast. Real break holds outside, retests from outside, expands.

Chart 13.1 / 13.2 — NY session + best hour

Busy 8:30–11. Best hour 10–11. NY often fakes London's high/low before the real move.

Chart 15.1 / 15.2 — Fake-move anatomy

Past a pre-drawn line, sensible distance, close back inside, long tail. Fake alone ≠ trade.

Chart 16.1 / 16.2 — The turn

Body close past last peak/dip. No turn → stand down.

Chart 17.1 / 17.2 — Pullback spots

Gap + last opposite candle + broken line. Overlap is best. Do not chase the turn candle.

Chart 18.1 / 18.2 — Stop & targets

Stop past fake extreme (watch second deeper fake). Targets = named piles, not a random R multiple.

5. Book → TradingView tool map

ON CHART / TABLE	BOOK MEANING
PDH / PDL	Yesterday's high & low (NY day) — biggest everyday piles
Asia-H / Asia-L + session shade	Overnight box (Ch 5) — London's trap box
RND ... sell if fake↑ / buy if fake↓	Round numbers (Ch 6)
NY DAY OPEN / WEEK OPEN	Starting prices (Ch 8) — magnets, dear vs cheap
20-day HIGH / LOW	IPDA / monthly-scale piles (Ch 9)
Blue / purple / green session shade	London / NY / best hour (Part 3)
LONDON OPEN / CLOSED markers	Session clock pins (top of pane)
Red dashed line above	BUY cash-out — next real pile up
Green dashed line below	SELL cash-out — next real pile down
FOCUS SELL / FOCUS BUY	Research lean — not an entry. Still wait fake→turn→pullback
Trade clock=NY · Display=Melb	Chapter 11 / 23 timezone policy, live

6. Daily checklist (Chapter 21)

BEFORE THE DAY

- NY logic on · news checked · PDH/PDL, week, 20/40/60, RNDs, opens ready

AFTER OVERNIGHT

- Asia box marked · twin tops/bottoms as small/bait · cheap vs dear vs day open

DURING LONDON (Melb now 4–7pm) & NEW YORK (Melb now 10:30pm–1am)

1. Past a line you drew beforehand?
2. Past by a sensible amount (~\$2–10)?
3. Closed back inside within a few candles?
4. Tail $\geq$ about a third of the candle?
5. Bigger pile just past it? If yes → stand down
6. Body turn within ~30 minutes?
7. Three pullback spots — any overlap?
8. Stop past fake extreme + buffer?
9. Deeper second fake since?
10. Nearest real target — do the numbers work?
